三代直线电机的优势:

- 扁平化: 组合高度相比一代更低, 重心更稳。
 - 防异物: 防护物品掉落内部结构, 减少异物掉落电机内部造成的电机损伤和飞车。
 - 易安装: 无需拆卸工件, 外部锁固螺丝即可完成安装。
 - 大推力: 对比二代, 同宽幅下, 推力更大。
 - 高刚性: 优化结构设计, 模组本身刚性提升, 可做横梁应用。
 - 重量轻: 本体重量轻, 多轴搭建降低下轴负担。
- Advantages of linear motor module II:
- Flattening: Compared with the 1st generation, height is lower and gravity is more stable.
 - Protection: protective items fall into the internal structure to prevent motor damage and derailment.
 - Easy to install: installation can be completed by locking the screws on the outside.
 - High thrust: Compared with the second generation, the thrust is greater under the same width.
 - High rigidity: optimized structural design, increased rigidity and it can be used as a beam.
 - Light weight: the main body is light, reduces the burden on the lower axis of multi-axis construction.

二代直线电机的优势:

- 扁平化:组合高度相比一代更低,重心更稳。
 - 防异物:防护物品掉落内部结构,减少异物掉落电机内部造成的电机损伤和飞车。
 - 易安装:无需拆卸工件,外部锁固螺丝即可完成安装。
 - 易维护:集中注油设计,无需拆卸工件即可完成注油保养。
 - 高刚性:优化结构设计,模组本身刚性提升,可做横梁应用。
 - 重量轻:本体重量轻,多轴搭建降低下轴负担。
- Advantages of linear motor module II:
- Flattening: Compared with the 1st generation, height is lower and gravity is more stable.
 - Protection: protective items fall into the internal structure to prevent motor damage and derailment.
 - Easy to install: installation can be completed by locking the screws on the outside.
 - Easy maintenance: centralized oil injection design, oil can be filled from the outside.
 - High rigidity: optimized structural design, increased rigidity and it can be used as a beam.
 - Light weight: the main body is light, reduces the burden on the lower axis of multi-axis construction.

直线电机是一种将电能直接转换成直线运动机械能,而不需要任何中间转换机构的传动装置。它可以看成是一台旋转电机按径向剖开,并展成平面而成。
Linear motor is a transmission device that converts electrical energy directly into linear motion mechanical energy without any intermediate conversion mechanism. It can be viewed as a rotating motor that is cut radially and spread out into a plane.

直线电机的优势:

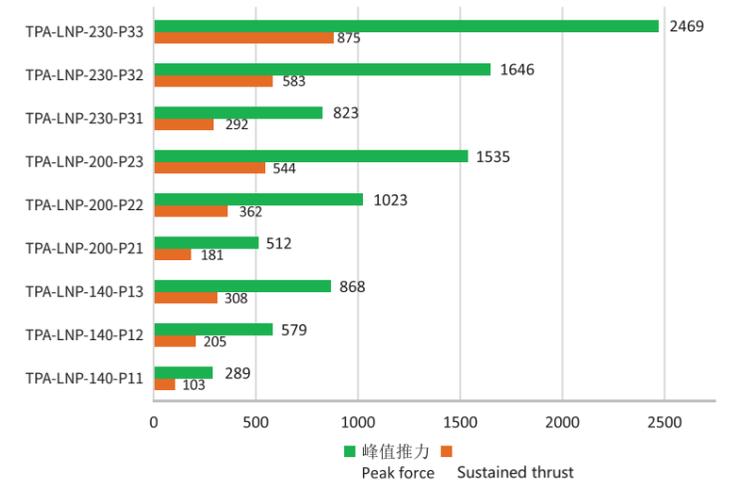

- 除了导轨和滑块外,无其他机械传动件,极大的降低了能量消耗,增强了产品可靠性和运行稳定性。
- 理论上行程不受限制,且长行程几乎对其性能无影响。
- 速度可以很快。因为不存在离心力的约束,普通材料亦可以达到较高的速度。运动时无机械接触,所以运动部分几乎无噪音。
- 加速度大。目前我司直线电机产品加速度可达5g。
- 精度高。减少了影响精度的中间环节,精度主要取决于检测原件,目前精度已达到微米级。
- 维护简单。因主要部件无机械接触,很好的减少了内部配件的磨损,所以直线电机几乎不需要维护。
- 运动惯量较小,动态响应性能好。

Advantages of linear motor:

- in addition to guide rail and slider, no other mechanical transmission parts, greatly reduce the energy consumption, enhance the reliability and stability of the product operation.
- Theoretically, the stroke is not limited, and the long stroke almost has no effect on its performance.
- Speed can be very fast. Because there is no centrifugal force constraints, ordinary materials can achieve higher speeds. There is no mechanical contact during movement, so the moving part is almost silent.
- large acceleration. At present, the acceleration of our linear motor products can reach 5g.
- high precision. Reduce the impact of the accuracy of the intermediate link, the accuracy depends on the detection of the original, the current accuracy has reached micron level.
- simple maintenance. Because the main components have no mechanical contact, it is very good to reduce the wear of internal accessories, so the linear motor almost does not need maintenance.
- the motion inertia is small, dynamic response performance is good.

直线电机选型指南

Guide to linear motor selection

1、直线电机的选型包括最大推力和持续推力需求的计算。

The selection of linear motor includes the calculation of maximum thrust and continuous force requirement.

2、最大推力由移动负载质量和最大加速度大小决定。

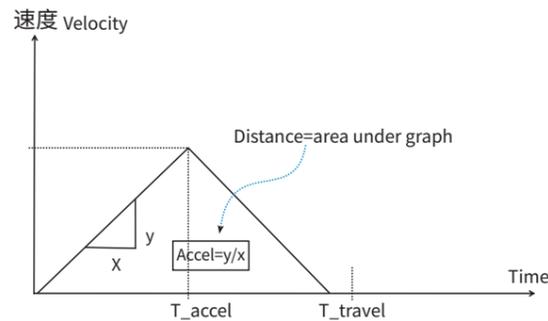

The maximum thrust is determined by the mass of moving load and the magnitude of maximum acceleration.

3、通常，我们不知道实际加速度需求。但是我们有电机运行时间要求。给定运动形成距离和所需行程时间，便可以此计算出所需的加速度。一般，对于短行程来说，我们推荐使用三角型速度模式(无匀速)，长行程的话，梯形速度模式会更有效率。在三角型速度模式中，电机的运动无匀速段。

In general, we don't know what the actual acceleration needs are. But we have the motor running time requirement. The desired acceleration can be calculated given the distance of motion and the required travel time. Generally, for short trips, we recommend using a triangular speed mode (no uniform speed). The trapezoidal speed mode is more efficient for long stroke. In the triangle speed mode, the motor motion has no uniform speed segment.

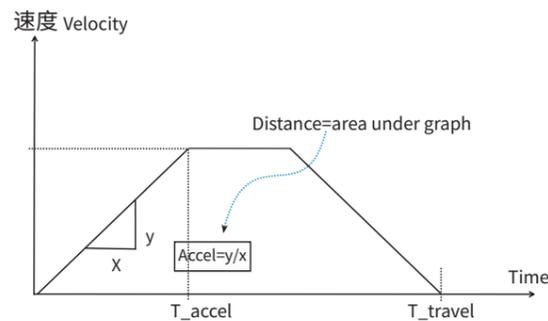

4、三角模式，加速度=4*位移/运动时间²

Triangular mode, Acceleration=4*displacement/(time)²

5、梯形模式，预设匀速度可以帮助解决加速度。

Trapezoidal mode, preset uniform speed can help solve acceleration.

加速度=匀速/(运动时间-位移/匀速)

Acceleration = uniform speed / (movement time - displacement / uniform speed)

6、相类似的，计算减速度大小与计算加速度相类似。除非存在一个不平衡的力(重力)作用在电机上。

Similarly, calculating the deceleration is similar to calculating the acceleration. Unless there is an unbalanced force (gravity) acting on the motor.

7、通常为了维持匀速过程和停滞阶段，摩擦力和外界应力的施力也需要计算。

注：为了维持匀速，电机会对抗摩擦力和外界应力。电机上伺服停滞时则会对抗外界应力。

Usually, in order to maintain the constant speed process and stagnation stage, the application of friction force and external stress also needs to be calculated.

Note: In order to maintain a constant speed, the motor will resist friction and external stress. When the upper servo of the motor stops, it will resist the external stress.

8、计算持续推力的公式如下：

The formula for calculating the sustained thrust is as follows:

$$RMSForce = \sqrt{\frac{Fa^2 \times Ta + Fc^2 \times Tc + Fd^2 \times Td + Fw^2 \times Tw}{Ta + Tc + Td + Tw}}$$

RMSForce=持续推力 Sustained thrust

Fa=加速度力 Acceleration force

Tc=匀速时间 Uniform time

Fc=匀速段力 Uniform speed force

Ta=加速时间 Acceleration time

Fd=减速度力 Deceleration force

Td=减速时间 Deceleration time

Fw=停滞力 Stagnation force

Tw=停滞时间 Stagnation time

9、根据最大推力和持续推力选择一个电机。客户应该将安全系数设为 20%-30% 以便将摩擦力和外界应力抵消为 0。

Select a motor according to the maximum thrust and Sustained thrust. Customers should set the safety factor to 20%-30% to offset the friction and external stress to zero.

10、举个例子，一个应用中，电机需在三角模式下让电机在 0.2 秒内，让 4KG 的负载移动 0.3 米。电机同行程中返程前停滞时间为 0.15 秒。

假设摩擦力和其它不平衡力不存在。

Select a motor according to the maximum thrust and continuous thrust. Customers should set the safety factor to 20%-30% to offset the friction and external stress to zero.

$$RSMForce = \sqrt{\frac{(120)^2 \times (0.1) + (120)^2 \times (0.1)}{0.1 + 0.1 + 0.15}} = 90.7N$$

加速度 Acceleration=减速度 Deceleration=4x0.3 / (0.2)² = 30m/s²

最大推力=加速度力 Acceleration force=减速度力 Deceleration force=负载 Load x 加速度 Acceleration=4x30=120N

STEP1 决定运动速度规划与运动参数,为能正确的决定出适合使用者需求的马达,选用前必须了解下列运动公式的计算。

Decide the motion speed planning and motion parameters. In order to correctly determine the motor suitable for users' needs, you must know the calculation of the following

运动公式 Motion formula

常用的基本运动学方程式描述如下: Common basic kinematics equations are described as follows:

$$V=V_0+aT$$

$$X=V_0T+\frac{1}{2}aT^2$$

其中V是速度,a是加速度,T是移动时间X是移动距离。Where V is the speed, A is the acceleration, T is the moving time and X is the moving distance.

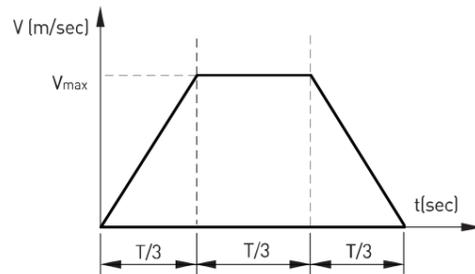

使用者可以选择这四个变数 (V,a,T与X) 中的任两个变数当设计值,剩下的两个变数可以由上述公式计算得到。

Users can choose any two of these four variables [V, A, T and X] as design values, and the remaining two variables can be calculated by the above formula.

速度规划 Speed planning

1、1/3-1/3-1/3梯形轨迹,若已先给定行程(X)与移动时间(T),则可以采用最常用也有效率的速度规划方式,也就是1/3-1/3-1/3梯形轨迹的点对点运动规划方式,因其可以提供一种最佳化运动方式同时只需要最少功率,其规划方式为将加速段、等速段、减速段分成三等阶段,其速度曲线如下:

1/3-1/3-1/3 trapezoidal track, if the travel [x] and moving time [t] are given first, the most commonly used and efficient speed planning method can be adopted, that is, 1/3-1/3 trapezoidal track. Trace point-to-point motion planning method, because it can provide an optimal motion mode and only need the least power, its planning method is to divide the acceleration section, the constant speed section and the deceleration section into three classes. By stages, its speed curve is as follows:

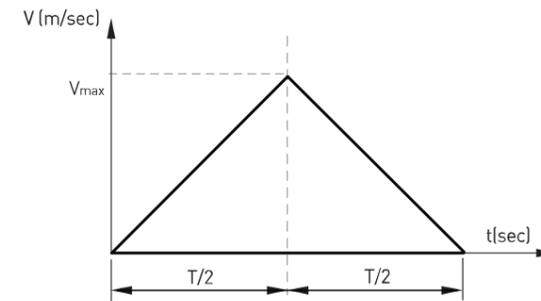

$$V_{\max} = 1.5 \times \frac{X}{T} \quad (\text{Because } X = \frac{V}{2} \times \frac{T}{3} + V \times \frac{T}{3} + \frac{V}{2} \times \frac{T}{3})$$

$$a_{\max} = \frac{V_{\max}}{T/3} = \frac{4.5X}{T^2}$$

在此用的参数定义同于运动公式里的描述 The parameter definitions used here are the same as those described in the motion formula.

2、1/2-1/2三角形轨迹若已先给定X与T,另一种常采用的运动规划方式亦即1/2-1/2三角形轨迹。其规划方式分成加速段与减速段两个部分。其速度曲线如下:

If x and t of 1/2-1/2 triangle trajectory are given first, another commonly used motion planning method is 1/2-1/2 triangle trajectory. The planning method is divided into two

$$V_{\max} = 2 \times \frac{X}{T}$$

$$a_{\max} = \frac{4X}{T^2}$$

第一种运动规划所计算出的加速度会大于第二种运动规划,因此采用第一种规划通常需要较大推力马达。而第二种规划的结果会选择较小的马达,可是因为其最大速度(Vmax)会比相对较大,所以需要确认是否足够。

The acceleration calculated by the first motion plan will be larger than that calculated by the second motion plan, so the first motion plan usually requires a larger thrust motor. The result of the second plan will be better. Small motor, but because its maximum speed (Vmax) will be relatively large, it is necessary to confirm whether it is enough.

3、常用公式 Common formula.

	1/3 -1/3-1/3 Trapezoid profile	Triangle profile
V (m/sec)	$1.5 \times \frac{X}{T}$	$2 \times \frac{X}{T}$, or $\sqrt{a \times X}$
a	$\frac{4.5X}{T^2}$	$\frac{4X}{T^2}$
t	$\frac{X}{V_{\max}} + \frac{V_{\max}}{a}$ (if $\frac{X}{V_{\max}} \geq \frac{V_{\max}}{a}$)	

直驱马达选配

Selection of direct drive motor

STEP2 瞬间推力与等效推力计算 Calculation of instantaneous thrust and equivalent thrust.

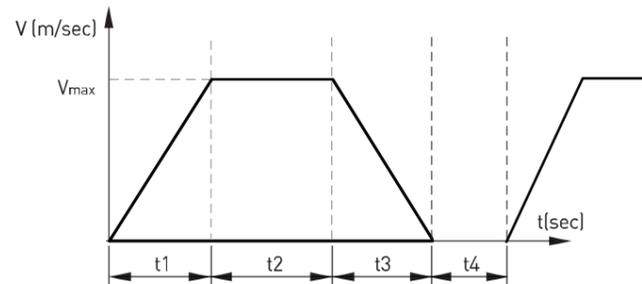

瞬间推力的计算可以由下式: The instantaneous thrust can be calculated by the following formula:

$$F_p = M_L \times a_{\max} + (M_L \times g + F_a) \times \mu = F_i + F_f$$

其中Fi是惯性力,而Ff是摩擦力,且μ是摩擦系数。在大部分的使用案例,运动方式常是周期性的点对点运动。假设一周期性运动,其中t4为运动完的停留时间,因此该周期运动的等效推力计算如下式:

Where Fi is inertia force, Ff is friction force, and μ is friction coefficient. In most use cases, the movement mode is often periodic point-to-point movement. Assume a periodic motion, where t4 is the residence time after exercise, so the equivalent thrust of this periodic exercise is calculated as follows:

$$F_e = \sqrt{\frac{(F_i + F_f)^2 t_1 + F_f^2 t_2 + (F_i - F_f)^2 t_3}{t_1 + t_2 + t_3 + t_4}}$$

对应的瞬间电流Ip与等效电流Ie可由马达推力常数代入下式计算得知。

The corresponding instantaneous current Ip and equivalent current Ie can be calculated by substituting the motor thrust constant into the following formula.

$$I_p = \frac{F_p}{K_f} \quad I_e = \frac{F_e}{K_f}$$

STEP3 由瞬间推力需求选择马达并确认驱动电流 Select the motor according to the instantaneous thrust demand and confirm the driving current.

透过TPA型录的马达规格表,使用者可以由瞬间推力需求选择适合的马达,之后使用者可以计算确认运动规划后所需供应电流是否有在规格限制内。

Through the motor specification table of TPA catalogue, the user can select a suitable motor according to the instantaneous thrust demand, and then the user can calculate and confirm whether the required supply current exists after the exercise planning. Within specifications.

$$I_p = \frac{F_p}{K_f} < I_p \text{ [查选用马达规格表] [Check the motor specification table]}$$

$$I_e = \frac{F_e}{K_f} < I_c \text{ [查选用马达规格表] [Check the motor specification table]}$$

使用者需要考量等效电流与连续电流的比值,通常规划后其比值(Ie/Ic)建议设计在0.7以内较安全。

Users need to consider the ratio of equivalent current to continuous current. Usually, after planning, its ratio [Ie/Ic] is recommended to be designed within 0.7, which is safer.

线性马达选用范例 Examples of linear motor selection.

举例来说,假设总负载有5公斤(移动机构1公斤与客户负载4公斤),摩擦系数μ为0.01,行程500mm,移动时间为400ms及停留时间为350ms。

For example, suppose that the total load is 5kg (1kg of mobile mechanism and 4kg of customer load), the friction coefficient μ is 0.01, the travel distance is 500mm, the moving time is 400ms and the residence time is 350ms.

一开始,我们可以计算这四项变数(Vmax、amax、Fp与Fe),在此列选择第一种运动规划方式,而马达选择LMC系列,推力计算结果如下:

At the beginning, we can calculate these four variables [Vmax, amax, Fp and Fe], select the first motion planning method in this column, and select LMC series for the motor. The thrust calculation results are as follows:

$$V_{\max} = 1.5 \times \frac{X}{T} = 1.5 \times \frac{0.5}{0.4} = 1.875 \text{ (m/sec)}$$

$$a_{\max} = \frac{4.5 \times X}{T^2} = \frac{4.5 \times 0.5}{(0.4)^2} = 14.06 \text{ (m/sec}^2\text{)}$$

$$F_p = M_L \times a_{\max} + (M_L \times g + F_a) \times \mu$$

$$= 5 \times 14.06 + 5 \times 9.81 \times 0.01 = 70.3 + 0.49 = 70.79 \text{ (N)}$$

$$F_e = \sqrt{\frac{[(70.3 + 0.49)^2 + 0.49^2 + (70.3 - 0.49)^2] \times 0.1333}{0.4 + 0.35}}$$

$$= 41.92 \text{ (N)}$$

在此列所得结果,可以选择瞬间推力有187N且连续推力有62N的LMCA6(p.46),其推力常数为33.8N/A(rms),驱动电流就可以随之得到:

I from the results obtained in this column, LMCA6(p.46) with instantaneous thrust of 187N and continuous thrust of 62N can be selected, and its thrust constant is 33.8 N/A (rms), and the driving current can be obtained as follows:

$$I_p = \frac{F_p}{K_f} = \frac{70.79}{33.8} = 2.09 \text{ (Arms)} < 5.4 \text{ (Arms)}$$

$$I_p = \frac{F_e}{K_f} = \frac{41.92}{33.8} = 1.24 \text{ (Arms)} < 1.8 \text{ (Arms)}$$

$$\frac{I_e}{I_c} = \frac{1.24}{1.8} \times 100\% = 68.89\% < 70\%$$

最后由电流计算结果,选择LMCA6可以符合此列的使用需求。

一、日常检查项目

直驱电机滑台属于高精度全闭环控制运动结构,通常采用光栅编码器配套光栅尺,或者磁栅编码器配套磁栅尺作为模组的位置反馈,精密导轨做为导向支撑。所以关于直驱电机的维护、保养,会直接影响到模组的正常运行。

日常检查项目	
1. 检查部件表面是否有损伤,压痕和摩擦情况。	2. 在模组的搬运、安装及使用过程中,注意不要触摸到光栅尺表面,以防污染光栅尺,影响读数头读数。
3. 使用时确保动子运动范围内不能有异物。	4. 所见部位是否有不明粉尘、油渍、痕迹等。
5. 若编码器为磁栅编码器,要防止带磁性的物体接触和靠近磁栅尺,以免造成磁栅尺磁性消退或被磁化,导致磁栅尺报废。	6. 检查读数头窗口及光栅尺表面是否有污损,检查读数头与各部件之间的连接螺钉是否有松动,通电后读数头信号灯是否正常。

二、周期维护项目

配件	维护方案	维护周期	具体操作
线性滑轨	增加润滑脂(粘度:30-150cts)清理旧油污,注入新润滑脂。	每月一次或每行走100KM的距离。	用无尘布直接擦拭干净轨道表面及轨道珠槽,将新润滑脂直接注入油孔。
光栅尺 磁栅尺	可用无尘布,丙酮/酒精进行清洗。	2个月/次(工作环境恶劣,酌情缩短维护周期)。	带上橡胶手套,用沾有丙酮的无尘布轻度按压在光栅尺表面,从光栅尺的一端擦向光栅尺另一端,注意不要来回擦拭,防止刮花光栅尺面,要始终沿一个方向擦拭,一至两次即可。维护完成后,通电检查读数头在全程感应光栅尺信号灯是否正常。

三、异常问题以及解决方法

一、Daily inspection items

Direct driver slide table belongs to a high-precision full-closed-loop motion control structure, and usually adopts grating encoder with grating ruler or magnetic grating encoder with magnetic grating ruler as the position feedback of the module. Precision guide rails are used as guide supports. Therefore, the maintenance of direct driver will directly affect the normal operation of the module.

Daily inspection items	
1. Check the surface of parts for damage, indentation and friction.	2. Be careful not to touch the grating ruler during the handling, installation and use of the module. Surface, to prevent pollution grating ruler, affect the reading head reading.
3. When using, make sure that there is no foreign matter in the moving range of the Mover.	4. See if there are any unknown dust, oil stains, traces, etc.
5. If the encoder is a magnetic grid encoder, it is necessary to prevent objects with magnetism from contacting and approaching magnetism. Grid ruler, so as not to cause the magnetism of the magnetic grid ruler to fade or be magnetized, resulting in the scrapping of the magnetic grid ruler.	6. Check whether the window of the reading head and the surface of the grating ruler are stained, whether the connecting screws between the reading head and various parts are loose, and whether the signal lamp of the reading head is normal after being electrified.

二、Periodic maintenance project

Parts	Maintenance scheme	Maintenance cycle	Specific operation
Linear slide rail	Add grease (viscosity: 30-150cts) Clean up old grease and inject new grease.	Once a month or every 100KM.	Clean the track surface and track bead groove directly with a dust-free cloth, and directly inject new grease into the oil hole.
Grating ruler Magnetic grating ruler	Clean with lint-free cloth and acetone/alcohol. Wash.	2 months/time (the working environment is harsh, so it can be reduced as appropriate. Short maintenance period).	Wear rubber gloves, gently press them on the surface of the grating ruler with a dust-free cloth dipped in acetone, and wipe them from one end of the grating ruler to the other. Be careful not to wipe them back and forth to prevent scratching the grating ruler surface. Always wipe them in one direction, once or twice. After the maintenance is completed, electrify and check whether the reading head senses the grating ruler signal lamp in the whole process.

三、Exceptions and solutions

Abnormal situation of direct-drive sliding table	Maintenance and troubleshooting methods
Motor overrun	1. The motor exceeds the limit position; 2. Adjust motor parameters; a) The whole software is reset after restarting. b) Check whether the length of the connecting rod between the motor and the walking arm is appropriate.
Unable to find motor origin.	1. The motor exceeds HM; 2. Manually move the walking arm and observe the position of the motor; a) Replace the reading head and restart the reset. b) Check whether the surface of the magnetic ruler is damaged, and if so, replace the magnetic grid ruler.
Unable to reset	1. Software problems; 2. Download motor board driver test again; a) Replace the drive board. b) Check whether the peripheral wiring of the drive board and motor is loose.
CAN bus communication alarm	a) Check the CAN Bus wiring for looseness. b) Unplug the bus connector on the PC board. If there is dust, clean it and plug it in again for testing. c) Test of replacing drive board and downloading program again.
There is abnormal noise jitter in direct driver operation.	1. Check the corresponding mechanical parts, make adjustments, and replace spare parts if necessary. 2. Adjust the motor PID parameters.

In addition, the company is responsible for the fault maintenance of its own goods, and is not responsible for other losses caused by product failure.
